# **Microsoft Malware detection**

# 1.Business/Real-world Problem

#### 1.1. What is Malware?

The term malware is a contraction of malicious software. Put simply, malware is any piece of software that was written with the intent of doing harm to data, devices or to people.

Source: https://www.avg.com/en/signal/what-is-malware

# 1.2. Problem Statement

In the past few years, the malware industry has grown very rapidly that, the syndicates invest heavily in technologies to evade traditional protection, forcing the anti-malware groups/communities to build more robust softwares to detect and terminate these attacks. The major part of protecting a computer system from a malware attack is to **identify whether a given piece of file/software** is a malware.

### 1.3 Source/Useful Links

Microsoft has been very active in building anti-malware products over the years and it runs it's anti-malware utilities over 150 million computers around the world. This generates tens of millions of daily data points to be analyzed as potential malware. In order to be effective in analyzing and classifying such large amounts of data, we need to be able to group them into groups and identify their respective families.

This dataset provided by Microsoft contains about 9 classes of malware.,

Source: https://www.kaggle.com/c/malware-classification

# 1.4. Real-world/Business objectives and constraints.

- 1. Minimize multi-class error.
- 2. Multi-class probability estimates.
- 3. Malware detection should not take hours and block the user's computer. It should fininsh in a few seconds or a minute.

# 2. Machine Learning Problem

### 2.1. Data

### 2.1.1. Data Overview

- Source : https://www.kaggle.com/c/malware-classification/data
- For every malware, we have two files
  - 1. .asm file (read more: https://www.reviversoft.com/file-extensions/asm)
  - 2. .bytes file (the raw data contains the hexadecimal representation of the file's binary content, without the PE header)
- Total train dataset consist of 200GB data out of which 50Gb of data is .bytes files and 150GB of data is .asm files:
- Lots of Data for a single-box/computer.
- There are total 10,868 .bytes files and 10,868 asm files total 21,736 files
- There are 9 types of malwares (9 classes) in our give data
- Types of Malware:
- 1 Ramnit

- 1. IXaIIIIII
- 2. Lollipop
- 3. Kelihos\_ver3
- 4. Vundo
- 5. Simda
- 6. Tracur
- 7. Kelihos\_ver1
- 8. Obfuscator.ACY
- 9. Gatak

### 2.1.2. Example Data Point

#### .asm file

```

# 2.2. Mapping the real-world problem to an ML problem

# 2.2.1. Type of Machine Learning Problem

There are nine different classes of malware that we need to classify a given a data point => Multi class classification problem

### 2.2.2. Performance Metric

Source: https://www.kaggle.com/c/malware-classification#evaluation

#### Metric(s):

- . Multi class log-loss
- · Confusion matrix

### 2.2.3. Machine Learing Objectives and Constraints

Objective: Predict the probability of each data-point belonging to each of the nine classes.

#### Constraints:

- · Class probabilities are needed.
- Penalize the errors in class probabilites => Metric is Log-loss.
- Some Latency constraints.

#### 2.3. Train and Test Dataset

Split the dataset randomly into three parts train, cross validation and test with 64%,16%, 20% of data respectively

# 2.4. Useful blogs, videos and reference papers

# 4.2 Modeling with .asm files

```
There are 10868 files of asm
All the files make up about 150 GB
The asm files contains:
```

```
1. Address
```

- 2. Segments
- 3. Opcodes
- 4. Registers
- 5. function calls
- 6. APIs

With the help of parallel processing we extracted all the features. In parallel we can use a 11 the cores that are present in our computer.

Here we extracted 52 features from all the asm files which are important.

We read the top solutions and handpicked the features from those papers/videos/blogs. Refer:https://www.kaggle.com/c/malware-classification/discussion

#### 4.2.1 Feature extraction from asm files

- To extract the unigram features from the .asm files we need to process ~150GB of data
- Note: Below two cells will take lot of time (over 48 hours to complete)
- . We will provide you the output file of these two cells, which you can directly use it

# 4.2.2 Univariate analysis on asm file features

#### In [18]:

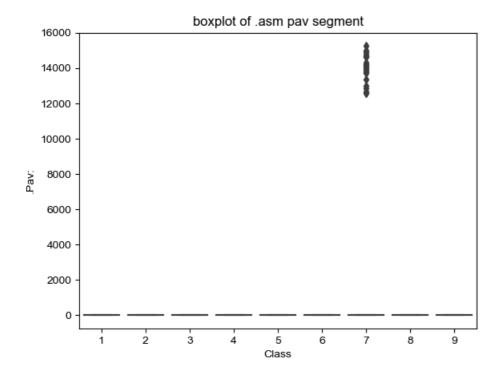

```
ax = sns.boxplot(x="Class", y=".text:", data=result_asm)
plt.title("boxplot of .asm text segment")
plt.show()
```

The plot is between Text and class Class 1,2 and 9 can be easly separated

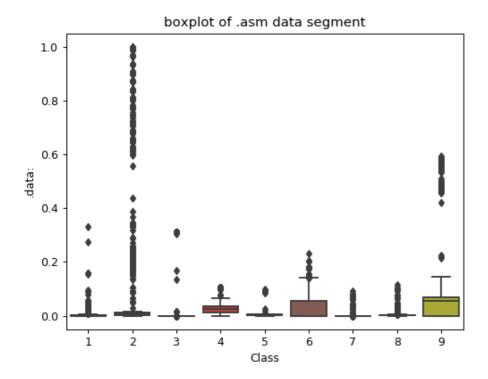

### In [19]:

```
ax = sns.boxplot(x="Class", y=".Pav:", data=result_asm)
plt.title("boxplot of .asm pav segment")
plt.show()
```

### In [19]:

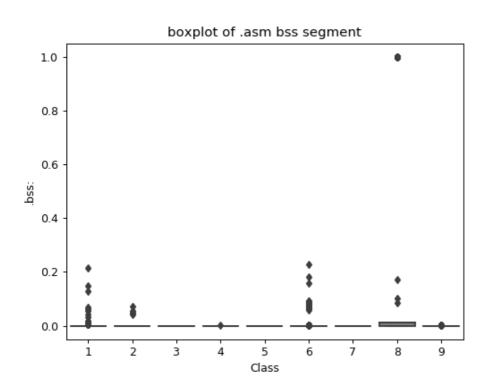

```
ax = sns.boxplot(x="Class", y=".data:", data=result_asm)
plt.title("boxplot of .asm data segment")
plt.show()
```

The plot is between data segment and class label class 6 and class 9 can be easily separated from given points

# In [20]:

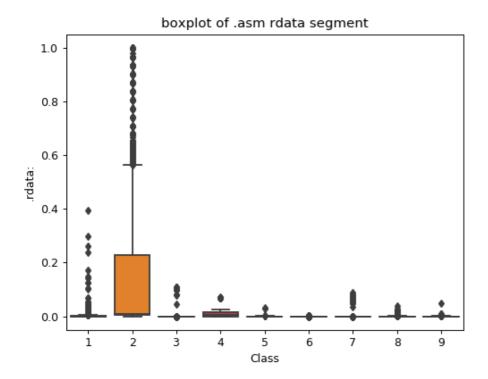

```
ax = sns.boxplot(x="Class", y=".bss:", data=result_asm)
plt.title("boxplot of .asm bss segment")
plt.show()
```

plot between bss segment and class label very less number of files are having bss segment

#### In [21]:

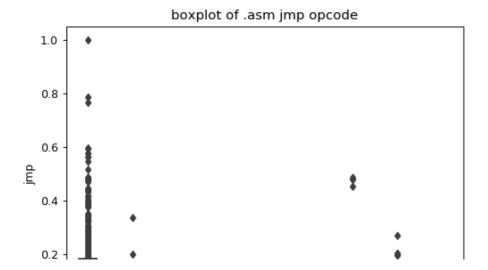

```
ax = sns.boxplot(x="Class", y=".rdata:", data=result_asm)
plt.title("boxplot of .asm rdata segment")
plt.show()
```

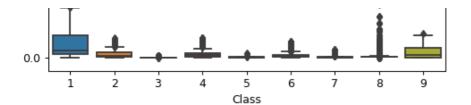

Plot between rdata segment and Class segment Class 2 can be easily separated 75 pecentile files are having 1M rdata lines

### In [22]:

```
ax = sns.boxplot(x="Class", y="jmp", data=result_asm)
plt.title("boxplot of .asm jmp opcode")
plt.show()
```

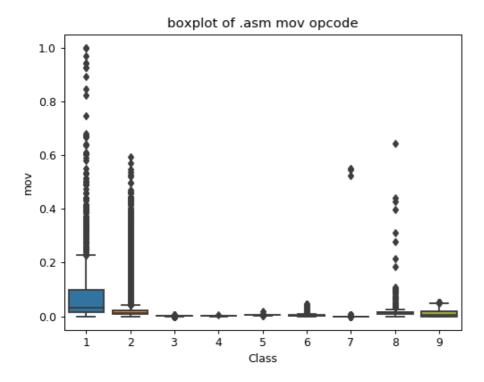

plot between jmp and Class label Class 1 is having frequency of 2000 approx in 75 perentile of files

## In [23]:

```
ax = sns.boxplot(x="Class", y="mov", data=result_asm)
plt.title("boxplot of .asm mov opcode")
plt.show()
```

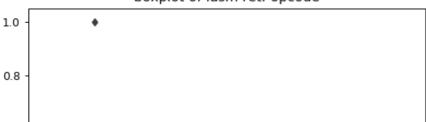

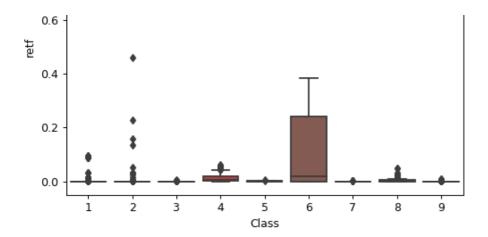

plot between Class label and mov opcode Class 1 is having frequency of 2000 approx in 75 perentile of files

#### In [24]:

```
ax = sns.boxplot(x="Class", y="retf", data=result_asm)
plt.title("boxplot of .asm retf opcode")
plt.show()
```

#### boxplot of .asm retf opcode

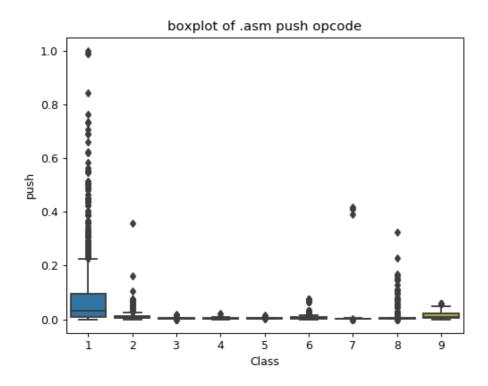

plot between Class label and retf Class 6 can be easily separated with opcode retf The frequency of retf is approx of 250.

#### In [25]:

```
ax = sns.boxplot(x="Class", y="push", data=result_asm)
plt.title("boxplot of .asm push opcode")
plt.show()
```

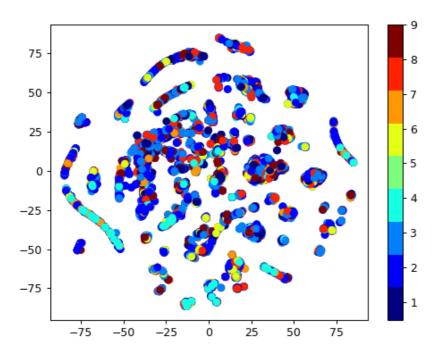

plot between push opcode and Class label Class 1 is having 75 precentile files with push opcodes of frequency 1000

## 4.2.2 Multivariate Analysis on .asm file features

## In [16]:

# check out the course content for more explantion on tsne algorithm
# https://www.appliedaicourse.com/course/applied-ai-course-online/lessons/t-distributed-stochastic
-neighbourhood-embeddingt-sne-part-1/

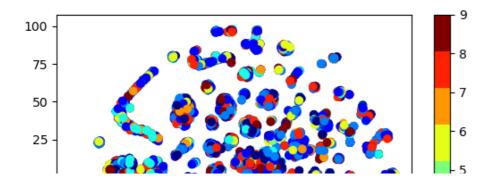

```
#multivariate analysis on byte files
#this is with perplexity 50
xtsne=TSNE(perplexity=50)
results=xtsne.fit_transform(result_asm.drop(['ID','Class'], axis=1).fillna(0))
vis_x = results[:, 0]
vis_y = results[:, 1  ]
plt.scatter(vis_x, vis_y, c=data_y, cmap=plt.cm.get_cmap("jet", 9))
plt.colorbar(ticks=range(10))
plt.clim(0.5, 9)
plt.show()
```

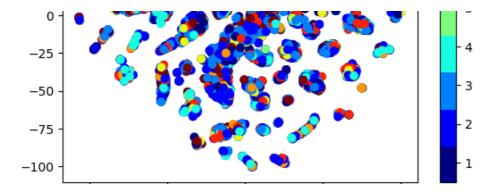

#### In [30]:

```
# by univariate analysis on the .asm file features we are getting very negligible information from
# 'rtn', '.BSS:' '.CODE' features, so heare we are trying multivariate analysis after removing tho
se features
# the plot looks very messy

xtsne=TSNE(perplexity=30)
results=xtsne.fit_transform(result_asm.drop(['ID','Class', 'rtn', '.BSS:', '.CODE','size'], axis=1
))
vis_x = results[:, 0]
vis_y = results[:, 1]
plt.scatter(vis_x, vis_y, c=data_y, cmap=plt.cm.get_cmap("jet", 9))
plt.colorbar(ticks=range(10))
plt.clim(0.5, 9)
plt.show()
```

TSNE for asm data with perplexity 50

#### 4.2.3 Conclusion on EDA

- We have taken only 52 features from asm files (after reading through many blogs and research papers)
- The univariate analysis was done only on few important features.
- Take-aways

In [13]:

- 1. Class 3 can be easily separated because of the frequency of segments,opcodes and keywords being less
- 2. Each feature has its unique importance in separating the Class labels.

Sum of rows in precision matrix [1. 1. 1. 1. 1. 1. 1. 1.]

# 5. Assignments

- 1. Add bi-grams and n-gram features on byte files and improve the log-loss
- 2. Using the 'dchad' github account (https://github.com/dchad/malware-detection), decrease the logloss to <=0.01
- Watch the video ( <a href="https://www.youtube.com/watch?v=VLQTRILGz5Y">https://www.youtube.com/watch?v=VLQTRILGz5Y</a>) that was in reference section and implement the image features to improve the logloss
